Did You Know ...

That during extreme cold temperatures water will freeze and expand, causing pipes to rupture. Any pipes not properly protected during freezing temperatures are vulnerable. Here are a few of the most common locations around your home where pipes tend to freeze:

- Pipes outside an insulated building, such as swimming pool, sprinkler, and outdoor kitchen supply lines.
- Pipes in crawlspaces, basements, garages, and attics.
- Pipes running through or along exterior walls.
- Pipes in any environment that are not insulated or climate-controlled.

Performing preventive maintenance tasks now will help to protect your home over the cold winter months.
